

<p>TROFIMUK, N. A.</p> <p>Ca</p> <p>14</p>																									
<p>A new process for the chemical treatment of sand or of the Raschig ring for the purpose of a very rapid disinfection of water. V. A. Uglov, N. A. Trofimuk, M. S. Egorov and G. S. Galt. <i>Trav. acad. militaire med. Armee Rouge U. R. S. S.</i>, 330-7 (1934); <i>Chem. Zentr.</i> 1936, II, 1219; cf. <i>C. A.</i>, 20, 3436. The silvered sand produced by reduction of an ammoniacal Ag⁺ soln. with HCHO is treated with a hot 3% KMnO₄ soln., which blackened the sand. It was then washed and dried at a temp. not exceeding 60°. Sand so treated showed an exceptionally powerful bactericidal action. Water contg. several hundred thousand intestinal bacteria per cc. was rendered sterile by one filtration. Water contg. large amts. of org. matter was effectively sterilized. The Raschig porcelain ring was subjected to the same treatment as the sand and its efficiency tested with a water contg. 300,000 bacteria per cc. After 15 min. the count fell to 30-50, a reduction of 99.99%.</p> <p>M. G. Moore</p>

USSR/Geological Prospecting
Petroleum

1948

"Prospects of Petroleum of the Upper Devonian and
Earlier Deposits of Western Bashkir," Q. A. Trofimuk,
5 pp

"Sovet Geolog" No 28

Description of the various surveys conducted in sub-
ject region. Work first begun in May 1940. On basis
of data obtained it can be stated that technicians
have high hopes for petroleum production in Volga-Ural
region. If data obtained by surveys is correct this
region should prove to be largest Soviet oil field.

AUTHOR: Trofin, Ion, Engineer

TITLE: Testing of rockets

PERIODICAL: Știință și Tehnică, no. 9, 1961, 18 - 19

TEXT: Having briefly described Major Titov's space flight with the "Vostok" space ship on August 6, 1961, the author presents the characteristic elements of tests to which rocket engines are subjected. The aerodynamic forces and engine coefficients are determined in open-circuit wind tunnels. The USSR also uses mobile installations traveling on 2 - 4-km-long rails with a speed ranging from 500 to 1,000 m/sec. Following these tests, the engines are examined in a test stand to determine their operational characteristics. There are two test stand versions: fixed test stands for heavy rocket engines and mobile test stands for less heavy rocket engines, with a traction power of 250 - 300 t. These stands can be moved in any direction to test the engines in various positions. The engines are finally installed in rockets and subjected to flight tests, to determine the various characteristics of the rocket, the rocket engine and the built-in instruments. There are 4 figures.

TITLE: Fatigue in aircraft structures

PERIODICAL: Referativnyy zhurnal, Vozdushnyy transport, no. 11, 1962, 8,
abstract 11A42 (Rev. trans. (RPR), v. 8, no. 12, 1961, 519-527
[Rum.; summaries in Russ., Ger., French and Eng.]).

TEXT: Analysis is made of repeated loads resulting in fatigue failure of aircraft structures. Types of fatigue cracks are given. Descriptions are given of fatigue-strength tests of aircraft and engines after prolonged service, and fatigue in jet- and piston-engine structures working under high temperature conditions. Measures are indicated for preventing accidents due to fatigue of structural materials. [Abstracter's note: Complete translation].

TITLE: Ramjet, an engine of the future

PERIODICAL: Stiintă și tehnică¹³, no. 12, 1961, 32-33

TEXT: The article deals with ramjet engines, describing their advantages, disadvantages and application possibilities. Their greatest disadvantage, compared with turbojet engines, is that they can not be used at low velocities and low altitudes. In order to increase the utilization possibilities of ramjet engines, Soviet scientists have combined them with turbojet engines, especially in VTOL aircraft. Such a combination is found in a Soviet helicopter which is equipped with a turbojet and a ramjet engine. The turbojet engine is used at the starting and landing operations as well as during the low-speed and low-altitude flights. The ramjet engine is put into operation at high-speed and high-altitude flights. The operation characteristics of the ramjet engine depend on

TITLE: Antigravity

PERIODICAL: Știința și tehnica, no. 4, 1962, 14-17

TEXT: A short review is presented of devices enabling partial annulment of the effects of the gravitational field, followed by a description of devices enabling the artificial creation of gravity fields, opposed to the terrestrial gravitational field, mentioning electrostatic condensers in the form of 60 and 90 cm discs charged to 50,000 and 150,000 volts respectively; also mentioned is the means of verifying the antigravitational properties of anti-matter particles -- non-deviation of a beam of pure anti particles under the affect of the terrestrial field of gravity. Several theoretical considerations and hypotheses on the character and properties of antigravity are briefly mentioned, and illustrated by several experiments on the "floating" of objects, including the experiment of V. Arkadiyev, in which above a lead disc, kept in liquid helium, at a temperature

<p>1056. GASIFICATION OF VOLKOV COAL. Troib, S.G. and Gasyuk, A.I. (Trudy Ural. Ind. in S.M. Kirova, 1941, No. 17, 139-54). Volkov coal (Kemerovsk region Urals) was found to be suitable for the manufacture of gas for use in open hearth furnaces. The desirable size is up to 40 mm. diam. with the fines screened out. A bed of coal 900-1100 mm. thick should be maintained in the generator. Normally the temperature of the gas should not exceed 600-50°. Suggestions are made for improving the design of the generator (Bomag and Grun Grzimilo) Grates.</p> <p style="text-align: right;">C.A.</p>

Classification of Kiselev-Afonin coal. S. G. Afonin and K. V. Malikov. *Ural. Met.* 1939, No. 3, 30-40; *Referat. Zhur.* 1939, No. 9, 83. The Kiselev coal (40-40-mm. particles) contained moisture 3-8%, ash 4.5-12%, volatile substances 10-20%. In a Guth-Rettger generator equipped with a Chapman rake satisfactory results were obtained with Kiselev coal alone or in 1:1 mixt. with Zhurin coal. The gas contained CO, 2.8, CO 28.9, H, 14.0, and CH, 2.4%. Kiselev coal and its mixt. with Zhurin coal produce gases of $Q = 1460$ cal. and $Q = 1500$ cal., resp. The slags are fine and dense. W. R. Houn

The gasification of fine coke and of coke-coal mixtures.
S. G. Trosh and K. V. Malikov. *Tral. Met.* 1939, No. 2, 11-17; *Russ. Referat. Zhur.* 1939, No. 8, 83. -- Fine coke from the Gubakhin coking plant and mixts. of this with Kizel coal (from the Lenin coal shaft) were gasified with steam in a generator 3 m. in diam. Air consumption was max. in the peripheral and central parts of the shaft. Slag movement was retarded near the walls and in the center of the shaft and distribution of fuel was uneven. The Gubakhin fine coke (6-16 mm.) was not inferior to the Magnitogorsk small coke (16-40 mm.) for operation of the generator. The heating value of the gas was $Q_H = 1261$ cal. The mixt. fused with a 1:1 proportion of fine coke and coal; Q_H was 1218 cal. Satisfactory results were obtained in the gasification of a mixt. of 70% small coke and 30% coal; the fusion of the mixt. was insignificant; Q_H was 1217 cal. A higher content of the Kizel coal is possible provided mechanical charging is employed and the mixt. kept porous. W. R. Henn

PROCESSES AND PROPERTIES INDEX

The exchange of absorbed anions in the red soils of Adaharian. B. B. Polunov and A. I. Trukhin. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 4, 49-50(1935).-- A series of expts. was carried out to det. whether or not the anions present in excess of cations in an extd. soil were at least partially absorbed. A 20-g. portion of a red, weathered soil was extd. with distd. water, filtered, and the filtrate was analyzed for P , Cl , SO_4 , and P . A similar ext. was made with 0.1 N NaH_2PO_4 (pH 5.01). The residue from the latter was then washed with distd. water, and the wash water likewise analyzed. It was found that 100 g. of the soil absorbed 0.563 g. of PO_4 ion that had displaced 0.016 g. of Cl ion and 0.378 g. of SO_4 ion. A sample of the soil horizon lying above the weathered material absorbed 1.29 g. of PO_4 ion per 100 g. of soil. This had replaced 0.017 g. Cl ion and 0.21 g. SO_4 ion.

*The Corrosion of Apparatus in the Wood-Chemical Industry.—Il. V. A. Troimkov (*Leningrad. Prom. (Wood-Chem. Ind.)*, 1940, 3, (2), 35-37; *Chem. Zentr.*, 1940, 111, (II), 1815; *C. Abs.*, 1942, 38, 5456).—[In Russian.] Experiences are given relating to the corrosion of apparatus, piping, and conveying equipment in contact with acetic acid of various concentrations, wood tar, ether, methyl alcohol, methyl acetate, and ketones. Copper was found to be a suitably resistant material for apparatus and pipes, bronze for armatures, and silver for soldering. Iron was found resistant in contact with the three last substances mentioned above. The observed corrosion of rustless steel was attributed to its contact with copper, and the couples resulting therefrom. The corrosion is proportional to the temperature and concentration of a sol.

<p><i>Determination of Cadmium in Zinc Concentrates and Metallic Zinc [by Internal Electrolysis]. J. J. Lurio and M. I. Troitskaya (Zavodskaya Laboratoria (Works' Lab.), 1936, 8, (12), 1425-1428 (in Russian); and (in German) Z. anal. Chem., 1936, 107, 34-41).—The Zn is dissolved in HNO₃, the solution treated with NH₄OH until the Zn(OH)₂ redissolves, and then with 2% Na₂S to precipitate the Cd, heavy metals and about 0.5 gm. of Zn, the precipitate collected, and, without washing, redissolved in 1:1 HNO₃, and the solution evaporated with H₂SO₄ to fumes. After removing Cu, Sb, Bi, Pb, Fe, Al, Mn, and As in the usual way, the p_H of the solution is adjusted to 5-2 by addition of H₂SO₄, CH₃CO₂H, and CH₃CO₂Na, and the cadmium then separated by placing in the solution a Fischer Pt gauze to the centre of which is attached a Zn plate by means of a Cu wire. Very accurate results are obtained and the method is more rapid than the usual H₂S method.—D. N. S.</i></p>

Al-S Reactions

Br. Abs.

Reaction between salts of platinum metals and derivatives of phosphorous acid. I. Action of triethyl phosphite and diethylphosphorous acid on tetrachloroplatinate (potassium chloroplatinate). A. A. Grünberg and A. D. Troitzkaja (Bull. Acad. Sci. U.R.S.S., Cl. Sci. Chim., 1944, 178—184). A 10% aq. solution of K_2PtCl_6 (13—15%) reacts with $P(OEt)_3$ to give a 31% yield of brick-red crystals of $[Pt(P(OEt)_3)_4][PtCl_6]$ (I); on removing this by filtration, there is further obtained a white cryst. material, $[Pt(P(OEt)_3)_4][P(OEt)_3O_2]$ (II), m.p. 93.5—94°. (I) can also be obtained by the action of K_2PtCl_6 on diethylphosphorous acid. In (I) can depolymerise to give $[Pt(P(OEt)_3)_4Cl_2]$, m.p. 52°. In these compounds Pt cannot be determined by ignition, owing to the formation of PtP_2 , but, after treatment of the compound, may be pptd. as the sulphide. V. B.

900. THE ROLE OF MICROSCOPIC TICKS IN THE PATHOLOGY OF SKIN
(Russian text) - Troitskaya A.D., Guselnikova M.I. and
Raznatovsky I.M. - VESTN. DERM. VENER. 1958, 32/1 (19-24) illus. 5
In 30 patients suffering from an exceedingly itchy rash, microscopy of the scales
revealed Sheremetewsky-Bogdanov's acarus dermatophagoides. In the first group
were the patients with signs of dry seborrhoea of the scalp (16 patients), 9 patients
of the second group had symptoms of seborrhoeic dermatitis, the last group of 5
patients had signs of neurodermitis. Many ticks were discovered in the down and
pillows on which the patients slept. Antiparasitic therapy was followed by a prompt
effect. Disinfection of clothes, underwear, bedclothes and destruction of infested
pillows is necessary.

TITLE:

On the Question of the Structure of Phosphorous Acid and Its Derivatives (K voprosu o stroenii fosforistoy kisloty i yeye proizvodnykh)

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 1, pp 79-81 (USSR)

ABSTRACT:

The reciprocal effect between an aqueous solution of potassium chloroplatinate, trimethyl phosphite and dimethyl phosphorous acid was investigated. The experimental data on the saponification process of dimethyl phosphorous acid and its complexes were found by measuring the change of the pH value. Equal concentrations of aqueous solutions of dimethyl phosphorous acid and $[Pt\{P(OCH_3)_2OH\}_2\{P(OCH_3)_2O\}_2]$ were heated in a water bath at 100°. After a certain time the pH value was measured at 20° in order to find out the difference of saponification between free dimethyl phosphorous acid and the acid coordinatively bound with bivalent platinum as an addendum. It is evident from the change of the pH value on heating that

On the Question of the Structure of Phosphorous Acid and Its Derivatives

free dimethyl phosphorous acid saponifies quicker during the first 15 minutes with a considerable reduction of the pH value of the solution. The saponification of group $P(OCH_3)_2OH$ in the complex $[Pt\{P(OCH_3)_2OH\}_2\{P(OCH_3)_2O\}_2]$ is insignificant. The qualitative and quantitative determination of the final products of the platinum complex saponification showed platinum, phosphorous and phosphoric acid. The saponification process is described as follows:

The experiments prove that in platinum complex compounds the addenda of dimethyl phosphorous acids and phosphorous acid contain trivalent phosphorus. There are 1 figure, 2 tables, and 9 references, 7 of which are Soviet.
